

Software
What is it? A requirement is a feature of the system or a description of something the system is capable of doing in order to fulfill the system's purpose.

↳ WHAT to do and not HOW to do it.

Work Product: RE produces one large document written in natural language, containing a description of WHAT system will do without describing HOW it will do it.

↳ Software Requirement Specification Doc (SRS)

Input to RE: Problem Statement prepared by customer.
↓
Overview of the existing system + New or additional functionality to be added.

Importance: Without well written requirements:-

- Developers will not know what to do.
- Customers may not be consistent abt reqmts
- It becomes difficult to validate/accept the SW

Requirements Engineering (RE)

Understanding the + Documenting the requirements reqmts of customer

4 Steps In Requirement Engineering

1. Requirement Elicitation: Gathering of requirements
* requirements are identified with the help of customer. → existing system.

2. Requirement Analysis: Requirements are ident analysed to
→ find inconsistencies, contradictions
→ omissions

3. Requirement Documentation: End product of first 2 steps. Leads to
• preparation of SRS
• becomes foundation for design of SW.

4. Requirement Review / Reqmt Verification: To improve the quality
or
• SRS
