1

Review: Compilation/Interpretation

COMP 144 Programming Language Concepts
Felix Hernandez-Campos

2

Phases of Compilation

3

High-Level Programming Languages

- Two main goals:
 - *Machine independence*
 - *Ease of programming*
- High-level programming language are independent of any particular instruction set
 - But compilation to assembly code requires a target instruction set
 - There is a trade-off between machine independence and efficiency
 - » E.g. Java vs. C

4

Ease of Programming

- The driving problem in programming language design
- The rest of this class
 - Names
 - Control Flow
 - Types
 - Subroutines
 - Object Orientation
 - Concurrency
 - Declarative Programming

COMP 144 Programming Language Concepts
Felix Hernandez-Campos

5

Naming

- **Naming** is the process by which the programmer associates a name with a potentially complicated program fragment
 - The goal is to hide complexity
 - Programming languages use name to designate variables, types, classes, methods, operators,...
- Naming provides *abstraction*
 - E.g. Mathematics is all about the formal notation (i.e. naming) that lets us explore more and more abstract concepts

COMP 144 Programming Language Concepts
Felix Hernandez-Campos

6

Control and Data Abstraction

- **Control abstraction** allows the programmer to hide an arbitrarily complicated code behind a simple interface
 - Subroutines
 - Classes
- **Data Abstraction** allows the programmer to hide data representation details behind abstract operations
 - ADTs
 - Classes

COMP 144 Programming Language Concepts
Felix Hernandez-Campos

7

Binding Time

- A **binding** is an association between two things
 - E.g. Name of an object and the object
- **Binding time** is the time at which a binding is created
 - Language design time
 - Language implementation
 - Program writing time
 - Compile Time
 - Link Time
 - Load Time
 - Run Time

COMP 144 Programming Language Concepts
Felix Hernandez-Campos

8

Binding Time Impact

- Binding times have a **crucial** impact in programming languages
 - They are a fundamental design decision
- In general, early binding is associated with greater efficiency
 - E.g. C string vs. Java's StringBuffer
- In general, late binding is associated with greater flexibility
 - E.g. Class method vs. Subroutine
- Compiled languages tend to bind names earlier than interpreted languages

COMP 144 Programming Language Concepts
Felix Hernandez-Campos

9

Object Lifetime

- Events in the life of an object
 - Creation
 - Destruction

} **Object Lifetime**
- Events in the life of a binding
 - Creation
 - Destruction
 - » A binding to an object that no longer exists is called a *dangling reference*
 - Deactivation and Reactivation

COMP 144 Programming Language Concepts
Felix Hernandez-Campos

10

Storage Allocation Mechanisms

- In **static allocation**, objects are given an absolute address that is retained throughout the program's execution
 - E.g. Global variables, Non-recursive Subroutine Parameters

COMP 144 Programming Language Concepts
 Felix Hernandez-Campos

11

Static Allocation

COMP 144 Programming Language Concepts
 Felix Hernandez-Campos

12

Storage Allocation Mechanisms

- In **static allocation**, (static) objects are given an absolute address that is retained throughout the program's execution
 - E.g. Global variables, Non-recursive Subroutine Parameters
- In **stack-based allocation**, (stack) objects are allocated in last-in, first-out data structure, a *stack*.
 - E.g. Recursive subroutine parameters

COMP 144 Programming Language Concepts
Felix Hernandez-Campos

13

Stack-based Allocation

COMP 144 Programming Language Concepts
Felix Hernandez-Campos

14

Storage Allocation Mechanisms

- In **static allocation**, (static) objects are given an absolute address that is retained throughout the program's execution
 - E.g. Global variables, Non-recursive Subroutine Parameters
- In **stack-based allocation**, (stack) objects are allocated in last-in, first-out data structure, a *stack*.
 - E.g. Subroutine parameters
- In **heap-based allocation**, (heap) objects may be allocated and deallocated at arbitrary times
 - E.g. objects created with C++ `new` and `delete`

COMP 144 Programming Language Concepts
Felix Hernandez-Campos

15

Heap-based Allocation

- The **heap** is a region of storage in which subblock can be allocated and deallocated
 - This not the *heap data structure*

COMP 144 Programming Language Concepts
Felix Hernandez-Campos

16

Heap Space Management

- In general, the heap is allocated sequentially
- This creates space **fragmentation** problems
 - *Internal fragmentation*
 - » If size of object to allocated is larger than the size of the available heap
 - *External fragmentation*
 - » If size of object to allocated is not larger than the size of the available heap, but the available space in the heap is scattered through the head in such a way that no contiguous allocation is possible
- Automatic deallocation after an object has no bindings is called *garbage collection*
 - E.g. Java
